Objective

Establish properties of quadrilaterals using congruent triangles and angle properties, and solve related numerical problems using reasoning.

Equipment

For this activity you will need:

- TI-Nspire
- TI-Nspire file: “Angles in Quadrilaterals” (tns)
- TI-Navigator system (Optional)

When using the optional TI-Navigator system, answers in **RED** are corrected automatically.

Problem 1 – Properties of Rhombi

You will begin this activity by looking at angle properties of rhombi. On page 1.3, you are given rhombus *READ* and the measure of angles *R*, *E*, *A*, and *D*.

Question: 1.

Move point *E* to four different positions and collect the measures of *R*, *E*, *A*, and *D* and record your measurements in the table below.

Position	<i>R</i>	<i>E</i>	<i>A</i>	<i>D</i>
1	$\angle DRE = \angle DAE$	$\angle AER = \angle ADR$	$\angle DAE = \angle DRE$	$\angle ADR = \angle AER$
2	Individual answers will vary but follow the equality pairs above. Note also that $\angle DRE + \angle REA = 180^\circ$ and $\angle REA + \angle EAD = 180^\circ$			
3				
4				

Question: 2.

Consecutive angles of a rhombus are **supplementary**.

Question: 3.

Opposite angles of a rhombus are **congruent**.

Next, you will look at the properties of the angles created by the diagonals of a rhombi. On page 1.7, you are given rhombus *CARD* and the measure of angles *CSA*, *ASR*, *RSD*, and *DSC*.

Question: 4.

Move point *C* to four different positions. Angles formed by the intersection of the two diagonals of a rhombus are **right angles (90°)**.

On page 1.10, you are given rhombus *RHOM* and the measure of all angles created by the diagonals of the rhombus.

Question: 5.

The diagonals of a rhombus **bisect** the vertices.

Problem 2 – Properties of Kites

You will begin this problem by looking at angle properties of kites. You are given kite *KING* and the measure of angles *K*, *I*, *N*, and *G*.

Question: 6.

Move point *I* to two different positions and point *K* to two different positions and collect the measures of *K*, *I*, *N*, and *G* and record your measurements in the table below.

Position	<i>K</i>	<i>I</i>	<i>N</i>	<i>G</i>
1	$0^\circ < \angle GKI < 180^\circ$	$\angle KGN = \angle KIN$	$0^\circ < \angle GKI < 180^\circ$	$\angle KGN = \angle KIN$
2				
3				
4				

Question: 7.

What do you notice about the opposite angles of a kite?

One pair of opposite angles are congruent (equal).

Next, you will look at the properties of the angles created by the diagonals of a kite. On page 2.5, you are given kite *BLUE* and the measure of angles *BSL*, *LSU*, *USE*, and *ESB*.

Question: 8.

Move point *L* to four different positions. Angles formed by the intersection of the two diagonals of a kite are **right angles (90°)**.

On page 2.8, you are given rhombi *KITE* and the measure of all angles created by the diagonals of the rhombus.

Question: 9.

Move point *K* to four different positions. What do you notice about the angles created by the diagonals of a kite? **The non-congruent angles are bisected by the diagonal.**

Problem 3 – Properties of Trapezoids

In this problem, you will look at angle properties of trapezoids. You are given trapezoid $TRAP$ and the measure of angles T , R , A , and P .

Question: 10.

Move point R to four different positions and collect the measures of T , R , A , and P onto the table below.

Position	T	R	A	P
1	$\angle RTP + \angle ART = 180^\circ$	$\angle RTP + \angle ART = 180^\circ$	$\angle RAP + \angle APT = 180^\circ$	$\angle RAP + \angle APT = 180^\circ$
2				
3				
4				

Question: 11.

What do you notice about the angles of a trapezoid?

Angles pairs formed on each of the parallel sides are supplementary.

Problem 4 – Beyond Observation (Extension)

Students in year 8 can be extended by providing opportunities for simple proofs such as: “Formulate proofs involving triangle congruency and angles properties” – ACMMG243 [Year 10]. Accessing these types of questions provides students an opportunity to demonstrate some skills above the expected level.

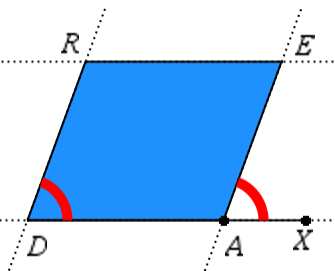

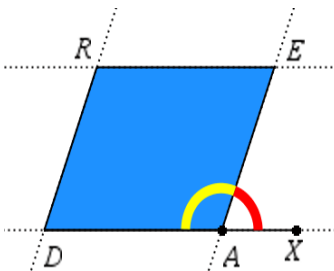

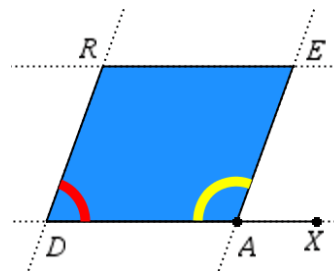

Parallelogram:

“A quadrilateral with pairs of opposite sides parallel”.

Parallelograms have many properties that are a consequence of this definition. In problem 4 a parallelogram has been constructed. On page 4.1 the angle properties are explored through a series of steps. Follow these steps then answer the questions below.

Question: 12.

Name and describe the relationship between each angle pair.

<p>a)</p>  <p>Corresponding angles $\angle EAX = \angle RDX$</p>	<p>b)</p>  <p>Supplementary angles $\angle EAX + \angle EAD = 180^\circ$</p>	<p>c)</p>  <p>Supplementary angles $\angle EAX + \angle RDX = 180^\circ$</p>
<p>d)</p>	<p>e)</p>	

Supplementary angles

$$\angle EAD + \angle AER = 180^\circ$$

Opposite angles are congruent

$$\angle AER = \angle ADR$$

The interactive diagram on page 4.2 provides guided steps, to help prove that opposite sides of a parallelogram are equal in length.

Question: 13.

Use the interactive diagram to help formulate a proof to show that the opposite sides of a parallelogram are equal.

RE and *DE* are parallel

$$\angle ARE = \angle RAD$$

$$\angle DRA = \angle EAR$$

RA is common side

$$\triangle AER \cong \triangle ADR$$

$$\text{Side ER} = \text{Side AD}$$

$$\text{Side DR} = \text{Side AE}$$

Parallelogram

Alternate angles (RA is transversal)

Alternate angles (RA is transversal)

Congruent triangles ASA

Congruent triangles

Congruent triangles

Therefore opposite sides of a parallelogram are equal.
